In your own words, briefly explain the difference between git add and git commit, and between git push and git pull.

Git add is saving changes for a particular area without actually saving to history yet like a placeholder that stores recent changes while Git commit locks those saved changes into git permanent history.

Git push is used to upload or send a local commit into Github (or other platforms) so it can be accessible to others while git pull is used to download an uploaded commit into your local computer.

What is the purpose of branches?

Branches permits/allows developers to implement or try out new features without altering the stable version of a code.

What causes a merge conflict?

It is a result when git cannot figure out how to automatically merge two branches together and can be a consequences of several factors such as different edit of a same file/line, untracked deletion of files and so on

What is the purpose of .gitignore?

This is a list of files you tell git to never keep track of. It allows you keep confidential details or unwanted files untracked and never uploaded to the public e.g .env, node_modules and so on.

What is the difference between a local and remote repository?

A local repository lives on a local machine and one can edit and view history offline while a remote repository lives on a server like Github, Gitlab and so on
